Executive Commit Review

From "Zeb said" to shipped.

A review mechanism for converting founder intent into one coherent decision, agent/human work split, accountable delivery path, and evidence return.

Use When

A cross-functional priority, customer/product signal, function redesign, or board-critical issue would otherwise diffuse across teams, documents, meetings, and status updates.

1 | Commit Definition

Intent What changes? Why now? What is outside scope? Owner writes one sentence.	Decision What tradeoff is being made? Who has authority? What condition reopens the decision?
Work split What is agent-default? What remains human-required? What triggers escalation?	Delivery Who owns the outcome? What dependencies and unblock paths matter? What is shipped?
Evidence What outcome, adoption, quality, risk, and learning determine the next decision?	

2 | Executive Review Questions

- Value: What gets better for a customer, employee, or business outcome? What work disappears - not merely moves?
- Authority: Who can decide without another meeting? Which decision may an agent never make?
- Coherence: Which teams experience the consequence? Where could local optimization damage the whole?
- Proof: What observable result closes this commit? What evidence would make us stop or redesign?

3 | Disposition

State	Meaning	Required evidence
COMMIT TO SHIP	Decision and authority are sufficient; delivery path is credible.	Owner, finish line, dependencies, and measures named.
REDESIGN FIRST	The process or work model is the problem.	First-principles decomposition and bounded pilot.
HOLD FOR SIGNAL	Consequence is real but evidence is insufficient.	Specific evidence request, owner, and revisit date.
STOP	Work does not justify attention or duplicates a better path.	Decision recorded; dependencies and stakeholders closed.

Executive Commit Review | worked example

Illustrative Cross-Functional Priority

Scenario: a CEO-generated product and customer priority touches Product, GTM, Finance, and Operations. This example is illustrative and does not claim knowledge of ClickUp's internal process or data.

Intent Resolve the customer problem and validate the business implication without creating a parallel priority stream. Non-goal: do everything now.	Decision Product leader classifies the signal as immediate fix, discovery input, strategic bet, operating defect, or watch item. CEO sees the disposition and tradeoff.
Work split Agents retrieve comparable signals, release history, dependencies, and open commitments. Humans judge product meaning, customer consequence, and priority.	Delivery One accountable owner publishes the response date, dependency path, and definition of shipped back to affected teams. Escalate if authority or evidence conflicts.
Evidence Decision latency, repeat-signal frequency, customer response, shipped change, adoption, and observed business outcome. Learning returns to product and CEO brief.	

Weekly Review

Question	Readout	Action
What changed?	New evidence, dependency, risk, or decision	Update commit, not a parallel slide
What is blocked?	Owner, blocker age, decision needed	Resolve, reassign, or stop
What can agents now own?	Repeatable work with context and guardrails	Move to agent-default with auditability
What still requires human judgment?	Tradeoff, exception, relationship, consequence	Name the accountable leader
What closes this?	Shipped result and evidence threshold	Close, redesign, hold, or stop

Anti-Bureaucracy Guardrails

No duplicate reporting The commit is the current operating record, not a summary of another system.	No agent theater AI must remove work, improve decisions, or strengthen evidence - not generate more content.
No endless in progress Every review ends in ship, redesign, hold for specified signal, or stop.	No silent authority Human judgment and escalation thresholds remain named and auditable.

Success Test

After repeated use, the CEO should have better detail with less preparation burden; leaders should know what they own; agents should carry more recurring context work; cross-functional priorities should close faster; and the company should learn from shipped work rather than from status narration.
